

Produce

Your world is our inspiration

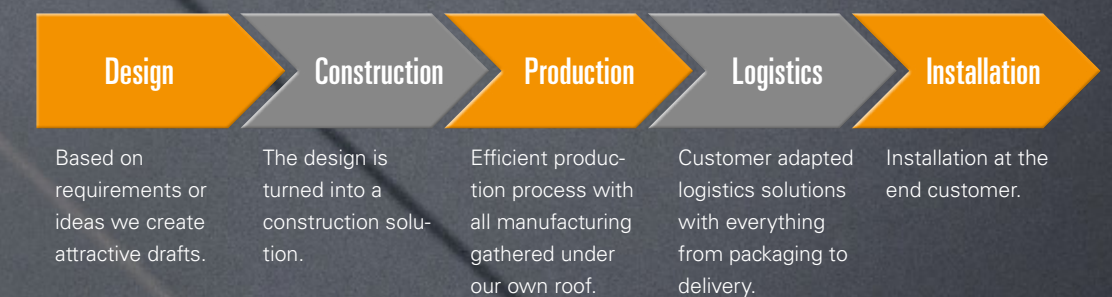

Our passion is interior and storage solutions for a professional environment. Shelving, tyre racks, shop displays, shop-in-shop solutions, to mention a few. Ideas are born within our walls, solutions are refined, developed and constructed. Quality, utility and effect are the end goals. Whether it concerns interior for inventory, archives, shops or other spaces. Feel free to choose between standard or tailor-made solutions. Almost anything is possible for us, everything is made within our own organization. Our production includes technical advanced machinery and dedicated staff, all in one building. That is why we have a control over all parts of the process.

Expose, store, produce

We can ensure high quality as well as rapid and precise deliveries. Your initial participation is also important. You know your market and target groups. Your input is your world, your goals and your demands. We add the things we do best, design, and choice of material, construction, production and delivery. A kind of mutual inspiration. The end result will be exactly as predicted, or even better. Since 2011 Steelo has been owned by Lagercrantz Group, a group with activity in seven countries and who have been listed on OMX Stockholm and Nasdaq since 2001.

Welcome to our creative workshop.

Our process

Advanced technology and skilled staff

All of our construction is done in Solid Works and goes hand in hand with production. Which in turn provides rapid and efficient development of new products. Added to this is our advanced technology, a production flow that is controlled by an intelligent MPS system with quality assurance at all stages. Thanks to our employees' experience and sterling ability prototypes can be evaluated and approved by the customer in good time before the series production.

Punching relentless

The punches are incredibly potent ingredients in our production. We have double fully automatic punches (of the brand Trumpf). During the day we run shorter series, during the night longer series, thus we utilize our advanced equipment to the maximum.

- Manages several operations such as: transformation, countersink and threading.
- Quality checks are carried out ongoing against the drawing.
- The punches are computerized and fully automated, the in- and out loading of material is performed by a robot.

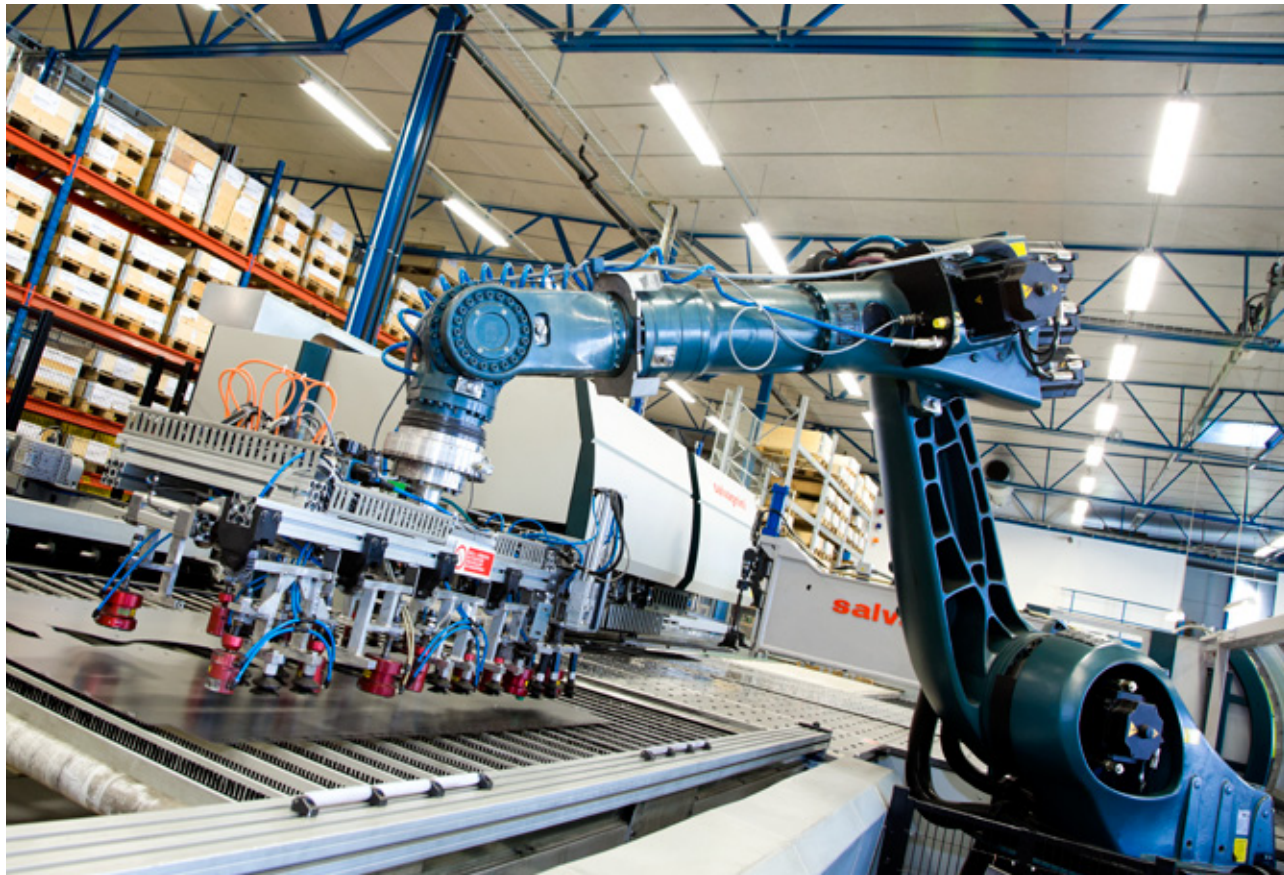

Powerful bending

Our modern line for panel bending is ideal for the production of long production runs. The machine is pre-programmed for the next run during operation.

- Extremely efficient production for long production runs.
- Fully automatic; scissors, punches, bends, degree turns, bends short and long side in one process.
- Even packing and powder coating is carried out in direct connection to the production.

Powerful bending

Our fully automatic bending machines are equipped with built-in scissors, supplemented with controlled press brakes. Thus we have a very sophisticated technology, which means that we can perform in basically all types of bends.

- Advanced bending machine for medium-sized and long production runs.
- Repetitive production for the highest quality.
- Computerized and fully automatic with extremely short set up time and automatic tool changes. The in- and out loading of material is performed by a robot.

- Suitable for small and medium-sized production runs.
- Environmentally friendly, with electric control, high precision and low power consumption.
- Computerized press brakes with short setup times, off-line programming and high flexibility.

Precision welding

As a rule, our designers seek to minimize welding operations. If required, we use mig-, tig- or spot welding through our experienced and skilled employees.

Cost efficient assembling

In close proximity to the powder facility, assembling and packaging of products or components occurs. Freight companies collect the goods from our facility for distribution directly to you as a customer, as stated we have control over the whole process.

Environmentally friendly powder coating

Before powder coating products undergo washing in an aqueous process. This is done in a completely closed system where manual handling is non-contact. The coating is made by special powder coating, an environmentally friendly thermoplastic. Of course we are able to produce exactly the nuance and colour as desired.

- Environmentally friendly powder coating plant with pre-programming and measuring of paint thickness, generates high quality coating.
- Modern powder kitchen from Wagner and pre-hanging of products that is done with special suspension, resulting in minimal setup time and optimal paint flow.
- Finishing is done with Bonderite for best results.
